Plotting the model performance

The `model.save_weights("model.h5")` command in TensorFlow/Keras is used to save the weights of our model to a file. This is particularly useful for saving the learned parameters of our model for later use.

```

In [15]: json_model = model.to_json()

with open("model.json", "w") as json_file:
    json_file.write(json_model)

# save full weights to HDF5
model.save("model_full.h5")
"Saved model to disk successfully"

```

```

Out[15]: 'Saved model to disk successfully'

```

```

In [16]: from tensorflow.keras.models import load_model

model = load_model("model_full.h5") # Load the full model

```

```

In [17]: model_fit.history.keys()

Plot the Confusion Matrics and display Classification Report

A confusion matrix is for summarizing the performance of a classification algorithm. It provides insights into the types and rates of errors made by the model.

Confusion Matrix Interpretation: Every row of the matrix represents the instances in an actual class while each column represents the instances in a predicted class. The diagonal elements will represent the number of points for which the predicted label is equal to the true label, while off-diagonal elements are those that are mislabeled through the classifier.

```
In [21]: plt.figure(figsize=(10,5))
plt.style.use('default')
cm=confusion_matrix(testing_gen.classes,y_pred)
labels = list(testing_gen.class_indices.keys())
sns.heatmap(cm,annot=True,fmt="d",xticklabels=labels,yticklabels=labels,cmap="Blues")
plt.xlabel('\nPrediction Label',fontsize=12)
plt.ylabel('Real Label\n',fontsize=12);
```

```

print(cr)
